METHOD AND APPARATUS FOR GENERATING A TRANSLATION TABLE

Abstract of the Disclosure

5

A method and apparatus for generating a translation table (105) is provided herein. The translation table is automatically generated by firstly accessing a domain model (301) and an SCL specification (303). With access to both domain model and the SCL specification, a translation table is then created

10   that associates elements of domain model to functions and arguments of the SCL specification. Because the translation table is created automatically based on the domain model and the SCL specification, a translation table can be quickly and easily created, with less errors than with prior-art techniques.
